

OVSAHO

Cat. No. ARC1036, 1×10^6 cells/vial

Description

OVSAHO is a human ovarian carcinoma cell line established from the abdominal metastatic tumor of a 56-year-old female with serous papillary adenocarcinoma. OVSAHO expresses several cytokeratins (CKs) peptides. OVSAHO cells are transplantable in both nude and immune-competent mice for intraperitoneal, subcutaneous, and orthotopic heterotransplantation.

OVSAHO cells and their xenograft models are used as experimental platform for studying high-grade serous adenocarcinoma (HGSOC). HGSOC grows rapidly and spread early to other tissues within the peritoneal cavity, and is therefore regarded as one of the most lethal forms of human ovarian cancer. The OVSAHO cells are used to develop strategies for early diagnosis and to screen potential anticancer agents targeting HGSOC.

Specification

Cell Type: Cancer cell line

Tissue/Organ: Ovary

Derived from Site: Metastatic; Abdomen

Disease: Serous adenocarcinoma

Species: Homo sapiens (Human)

Genetic Background: Japanese

Sex of Donor: Female

Age: 56 years

Shipping & Storage

Shipping condition: Frozen on dry ice.

Storage condition: Liquid nitrogen (LN₂) cryopreservation.

Intended Use

This product is intended for laboratory in vitro use only. It is not intended for diagnostic, therapeutic, or clinical applications.

Culturing Guidance

Morphology: Epithelial-like

Growth Mode: Adherent

Temperature: 37°C

Atmosphere: 5% CO₂

Unpacking and Storage Instructions

1. Visually inspect all packaging components for integrity and verify adequate dry ice.

If any damage is observed, notify Ascent Technical Support immediately.

2. Prioritize transfer to liquid nitrogen vapor phase storage system (-130°C or below).

Secondary option: -80°C mechanical freezer (short-term storage only).

Always maintain temperature strictly below -65°C.
